CL-2001 Data Structures Lab # 12

Objectives:

- Binary Heap
- Max, Min Heap
- Heapify
- Heap Sort

Note: Carefully read the following instructions (Each instruction contains a weightage)

- 1. There must be a block of comments at start of every question's code by students; the block should contain brief description about functionality of code.
- 2. Comment on every function and about its functionality.
- 3. Mention comments where necessary such as comments with variables, loop, classes etc to increase code understandability.
- 4. Use understandable name of variables.
- 5. Proper indentation of code is essential.
- 6. Write a code in C++ language.
- 7. Make a Microsoft Word file and paste all of your C++ code with all possible screenshots of every task **outputs** in **Microsoft Word and submit word file.**
- 8. First think about statement problems and then write/draw your logic on copy.
- 9. After copy pencil work, code the problem statement on MS Studio C++ compiler.
- 10. At the end when you done your tasks, attached C++ created files in MS word file and make your submission on Google Classroom. (Make sure your submission is completed).
- 11. Please submit your file in this format 21F1234_L11.
- 12. Do not submit your assignment after deadline. Late and email submission is not accepted.
- 13. Do not copy code from any source otherwise you will be penalized with negative marks.
- 14. Submit .cpp file of all tasks.

Problem: 1 | Binary heap

- 1) getMini(): It returns the root element of Min Heap.
- 2) extractMin(): Removes the minimum element from MinHeap...
- 3) insert(): Inserting a new key. We add a new key at the end of the tree. If new key is greater than its parent, then we don't need to do anything. Otherwise, we need to traverse up to fix the violated heap property.

Problem: 2 | Heap Sort

Heap sort is a comparison-based sorting technique based on Binary Heap data structure. It is similar to selection sort where we first find the maximum element and place the maximum element at the end. We repeat the same process for remaining element.

What is Binary Heap?

Let us first define a Complete Binary Tree. A complete binary tree is a binary tree in which every level, except possibly the last, is completely filled, and all nodes are as far left as possible.

A Binary Heap is a Complete Binary Tree where items are stored in a special order such that value in a parent node is greater(or smaller) than the values in its two children nodes.

The former is called as max heap and the latter is called min heap. The heap can be represented by binary tree or array.

Heap Sort Algorithm for sorting in increasing order:

- 1. Build a max heap from the input data.
- **2.** At this point, the largest item is stored at the root of the heap. Replace it with the last item of the heap followed by reducing the size of heap by 1. Finally, heapify the root of tree.
- **3.** Repeat above steps while size of heap is greater than 1.

Problem: 3 | K largest(or smallest) elements in an array

Write an efficient program for printing k largest elements in an array. Elements in array can be in any order.

For example, if given array is [1, 23, 12, 9, 30, 2, 50] and you are asked for the largest 3 elements i.e., k = 3 then your program should print 50, 30 and 23.

Problem: 4 | Convert BST to Min Heap

Given a binary search tree which is also a complete binary tree. The problem is to convert the given BST into a Min Heap with the condition that all the values in the left subtree of a node

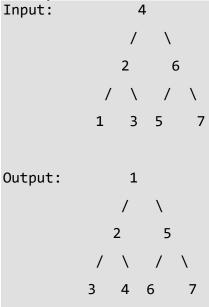

Of Computer & Emerging Sciences Faisalabad-Chiniot Campus

should be less than all the values in the right subtree of the node. This condition is applied on all the nodes in the so converted Min Heap.

Examples:

The given **BST** has been transformed into a

Min Heap.

All the nodes in the Min Heap satisfies the given condition, that is, values in the left subtree of a node should be less than the values in the right subtree of the node.

- 1. Create an array arr[] of size n, where n is the number of nodes in the given BST.
- 2. Perform the inorder traversal of the BST and copy the node values in the arr[] in sorted order.
- 3. Now perform the preorder traversal of the tree.

While traversing the root during the preorder traversal, one by one copy the values from the array arr[] to the nodes

Problem: 5 | Convert min Heap to max Heap

Given array representation of min Heap, convert it to max Heap

Example:

```
Input: arr[] = [3 5 9 6 8 20 10 12 18 9]

3

/ \
5 9

/ \ \
```

Of Computer & Emerging Sciences Faisalabad-Chiniot Campus

```
20
  6
        8
                10
   \
        /
     18 9
12
Output: arr[] = [20 18 10 12 9 9 3 5 6 8] OR
       [any Max Heap formed from input elements]
         20
       /
            \
     18
             10
       9 9
                3
  12
    6 8
```

The problem might look complex at first look. But our final goal is to only build the max heap. The idea is very simple – we simply build Max Heap without caring about the input. We start from bottom-most and rightmost internal mode of min Heap and heapify all internal modes in bottom up way to build the Max heap.
